Inventory Control

Built for the way products move today

Inventory Control is a powerful and flexible system that maintains inventory in multiple warehouses by product groups, in any unit of measurement by individual item codes. Each inventory item record stores information such as product group, units of measurement, quantities on-hand, vendors & suppliers with their purchase price, lead time, alternate items, minimum, maximum and reorder stock levels for each warehouse. The system is designed to track inventory items associated from the moment they are received from a vendor to the time they are issued to a customer or a cost center. On-screen inquiry features provide information on the purchase and issue of items by vendor, customer and warehouse, all at the press of a button.

Features

- * Developed in SQL Server 2000
- * Client-Server Environment
- * Online as well as Batch processing
- * 15 Character Inventory Code
- * Standard - Average costing methods
- * Inventory count changes and adjustments
- * Manages item issues, returns, adjustments, and inter warehouse transfers
- * Auto generation of inspection reports
- * Auto generation of goods received notes from purchase orders
- * Integration with all the FICS modules
- * Provides inventory status for each work order
- * Screen level User rights
- * Laser printing for all outputs
- * Exports all outputs to Word, Excel, Lotus, Web, HTML etc.
- * Drill down in all relevant outputs

Reports

- * Transactions history
- * Stock level listing
- * Stock valuation report
- * Stock activity report
- * Summary of stock activity
- * Reorder lists
- * Stock taking sheets
- * Inventory aging analysis
- * Inventory ABC analysis
- * Analysis of increase in inventory
- * Purchase Journal
- * Issue and return analysis
- * Consumption history
- * Price list and price updates
- * Purchase history
- * Available inventory
- * Inventory item list
- * Cost center wise consumption
